Introduction

Doggr is an application for breeders of pedigree dogs to find the perfect dog to breed with. Breeders create a profile for their dog with the relevant information and will be able to swipe other pedigree dogs. In phase 1 only account creation is supported, swiping and other functionalities will come later.

Running the application

1. Install Racket (version 8.0 or higher)
2. Unpack the uploaded code into the `doggr` folder
3. Open a terminal in the `doggr` folder.
4. Install the required libraries with `raco pkg install --auto`
5. Open `main.rkt` in DrRacket and click `run`
6. The application will open 4 GUIs, spread them out over the screen

Creating a dog profile

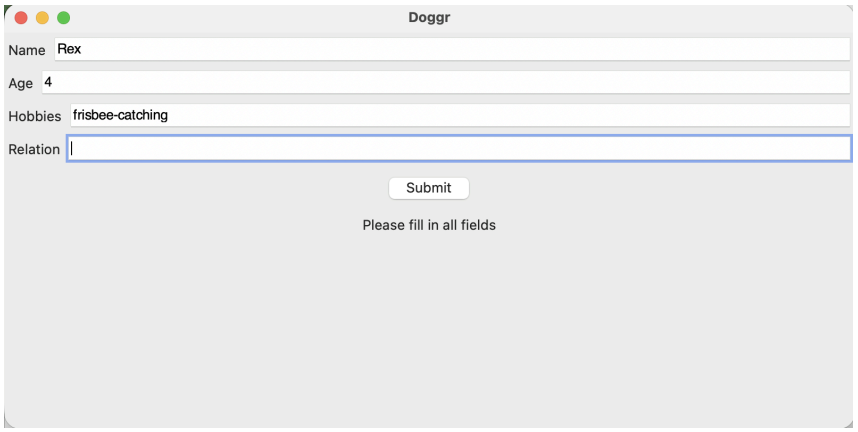

1. Pick one of the Doggr windows.

2. Fill in all fields and click on `Submit` to create a dog profile.

If everything was filled in correctly `Profile saved` is shown on the screen.

If not all fields were filled before clicking `Submit`, the message `Please fill in all fields` is displayed on the screen.

If the age was given as text rather than a number, clicking `Submit` will result in the message `Age must be a number` being displayed on the screen.
